

PRODUCT UPDATES · CUSTOMERS AND PARTNERS

One approved post, every customer channel

Our customers and partners talk to us in about sixty Slack channels, and Conclude carries the Teams ones. This report compares the tools that broadcast into those channels and recommends a skill we build ourselves. It needs no new seats.

PREPARED FOR
Badr Eddial

PREPARED BY
Autopilot · AP-18

DATE
5 October 2026

STATUS
Draft for decision

01 - WHAT WE FOUND

Every customer channel already runs through our own Slack.

Each customer gets a channel in our workspace, named **<customer>-lleverage**. Customers on Slack join it through Slack Connect. Conclude links the channels of customers on Teams to their own Teams channel. Sitech is one example: Conclude connected *#sitech-lleverage* to *Sitech-Lleverage / General* on 25 September. A message posted on our side reaches both platforms, so **we only have to post in Slack**.

~60

*-LLEVERAGE CHANNELS IN OUR SLACK

1

HUB: CONCLUDE MIRRORS IT TO TEAMS

0

TOOLS TODAY THAT POST TO MANY AT ONCE

What gets in the way

- **Slack posts to one channel at a time.** Workflow Builder needs one step per channel, drops rich formatting and breaks when the list changes.
- **Conclude cannot broadcast.** It syncs channel pairs, one to one. It has no announcement feature and no public API for one. It bills per internal user (\$12–16 a month) and charges \$5 a month for each external channel beyond the 10 in Pro.
- **The channel list is messy.** The ~60 channels mix live customers, partners (Incentro, Twofeetup), vendors (WorkOS), pilots and dormant accounts. Whatever we choose, someone has to curate the list of who receives which update.
- **Language differs.** Most of the base is Dutch. An update in English only reaches some readers less well.

What the setup must do

Need	Why
Reach Slack and Teams	Customers live on both. Through Conclude, a post in Slack covers both.
Approve before sending	The draft comes from #change-log and the PRs. A person approves before anything posts.
Target by audience	Customers, partners and pilots each get their own updates. Flagged features only go to customers who have the flag.
Surveys later	The same route later carries a short survey or NPS question.
No seats	Low cost. Anyone on the team can trigger it.

02 - OPTIONS COMPARED

The tools that broadcast to Teams cost \$3,000 to \$12,000 a year.

Pylon, Plain and ClearFeed are support desks with a broadcast feature added on. With them we would pay for a ticket queue we do not need. Changelog tools publish a page and send email, but they do not post into a customer's channel. List prices are from the vendors' sites in October 2026.

Option	Reaches	Pricing	Fit
Pylon Broadcasts	Slack Connect; Teams only on Enterprise	Per seat. \$89 on Professional (min. 3); \$139 on Enterprise (min. 7). About \$3k–12k a year.	Strong broadcast and analytics. It is a seat-based support desk, which you ruled out.
ClearFeed Broadcasts	Slack Connect, Teams	Per agent from \$24, or by usage from \$40 a month per 10 channels. ~60 channels is about \$2.9k a year.	Usage pricing is the closest fit. Check that Broadcasts is in that plan. It duplicates what Conclude already does for Teams.
Plain	Slack, Teams, email	Per seat	Support desk first. Ruled out on seats.
Featurebase, Beamer, LaunchNotes	Web changelog, email, in-app	Free for 1 seat with no integrations. \$29+ per seat after that.	Useful for a public changelog page and surveys. Does not post in customer channels.
Slack Workflow Builder	Slack (Teams via Conclude)	Included	One step per channel, plain text only. Breaks whenever the list changes.
Email (Loops, Resend)	Inbox	Free tiers for small lists	A fallback for partners without a shared channel. Not where customers talk to us.
Our own skill + Slack app	Slack, Teams via Conclude	€0 in tools. Claude usage only.	Built on the channels and the bridge we already pay for. Recommended.

Conclude's changelog lists "Sync bot messages", but we have not tested it. Before building, check that a message posted by a bot in a bridged channel reaches the Teams side. If it does not, the recommendation changes: Teams customers would then need ClearFeed or a direct Teams post.

03 - RECOMMENDED SETUP

A broadcast skill: draft from #change-log, approve, post to the list.

It follows the feature-drop pattern we already run. A Claude skill writes the update from #change-log and the PR descriptions. You approve it on a Linear issue. A small script then posts it through a Slack app that has only the **chat:write** permission. Nothing goes out until you approve.

The channel list

One file in the autopilot repo. Each channel has an audience (customer, partner, pilot), a language (EN or NL), its platform (Slack, or Teams via Conclude) and the feature flags the customer has. Badr curates it once. After that, new **-lleverage* channels show up as "to classify".

Surveys, phase two

Interactive Slack buttons are unlikely to survive the Conclude bridge, so a survey is a link to a short form, such as Tally on its free plan. The script tags each link with the channel, so answers come back per customer. Native buttons can come later for customers on Slack only.

Format rules that keep it working on Teams

- Plain Slack markdown: a bold title, three to five bullets and one link. Block Kit layouts and buttons are unlikely to render after the bridge. Step 01 tests this too.
- One message per channel and no @channel. Customers who want more detail can ask in the thread, where the account owner sees it.
- The bot has to be invited to every channel on the list, private ones included. The script shows the channels it cannot reach yet.

Option: run it as a Lleverage workflow

The same flow can run on our own platform: a data table holds the channel list, a schedule runs it, an approval step waits for you and a Slack node posts. It takes more effort to build. In return, the team can see it and trigger it without Claude Code, and we can show it as our own operations running on Lleverage.

WHAT HAPPENS NEXT

One test in a bridged channel decides the route.

STEP 01 · 1 DAY

Test the bridge

Create the Slack app and post one bot message in a test channel bridged to Teams. Check that it arrives as readable text.

STEP 02 · 1 HOUR

Curate the list

Autopilot drafts the list of ~60 channels with a best guess for each. Badr corrects the audience, language and flags.

STEP 03 · 2-3 DAYS

Build the skill

Draft, approve, post and log. First run: last week's feature drop, sent to five friendly customers.
